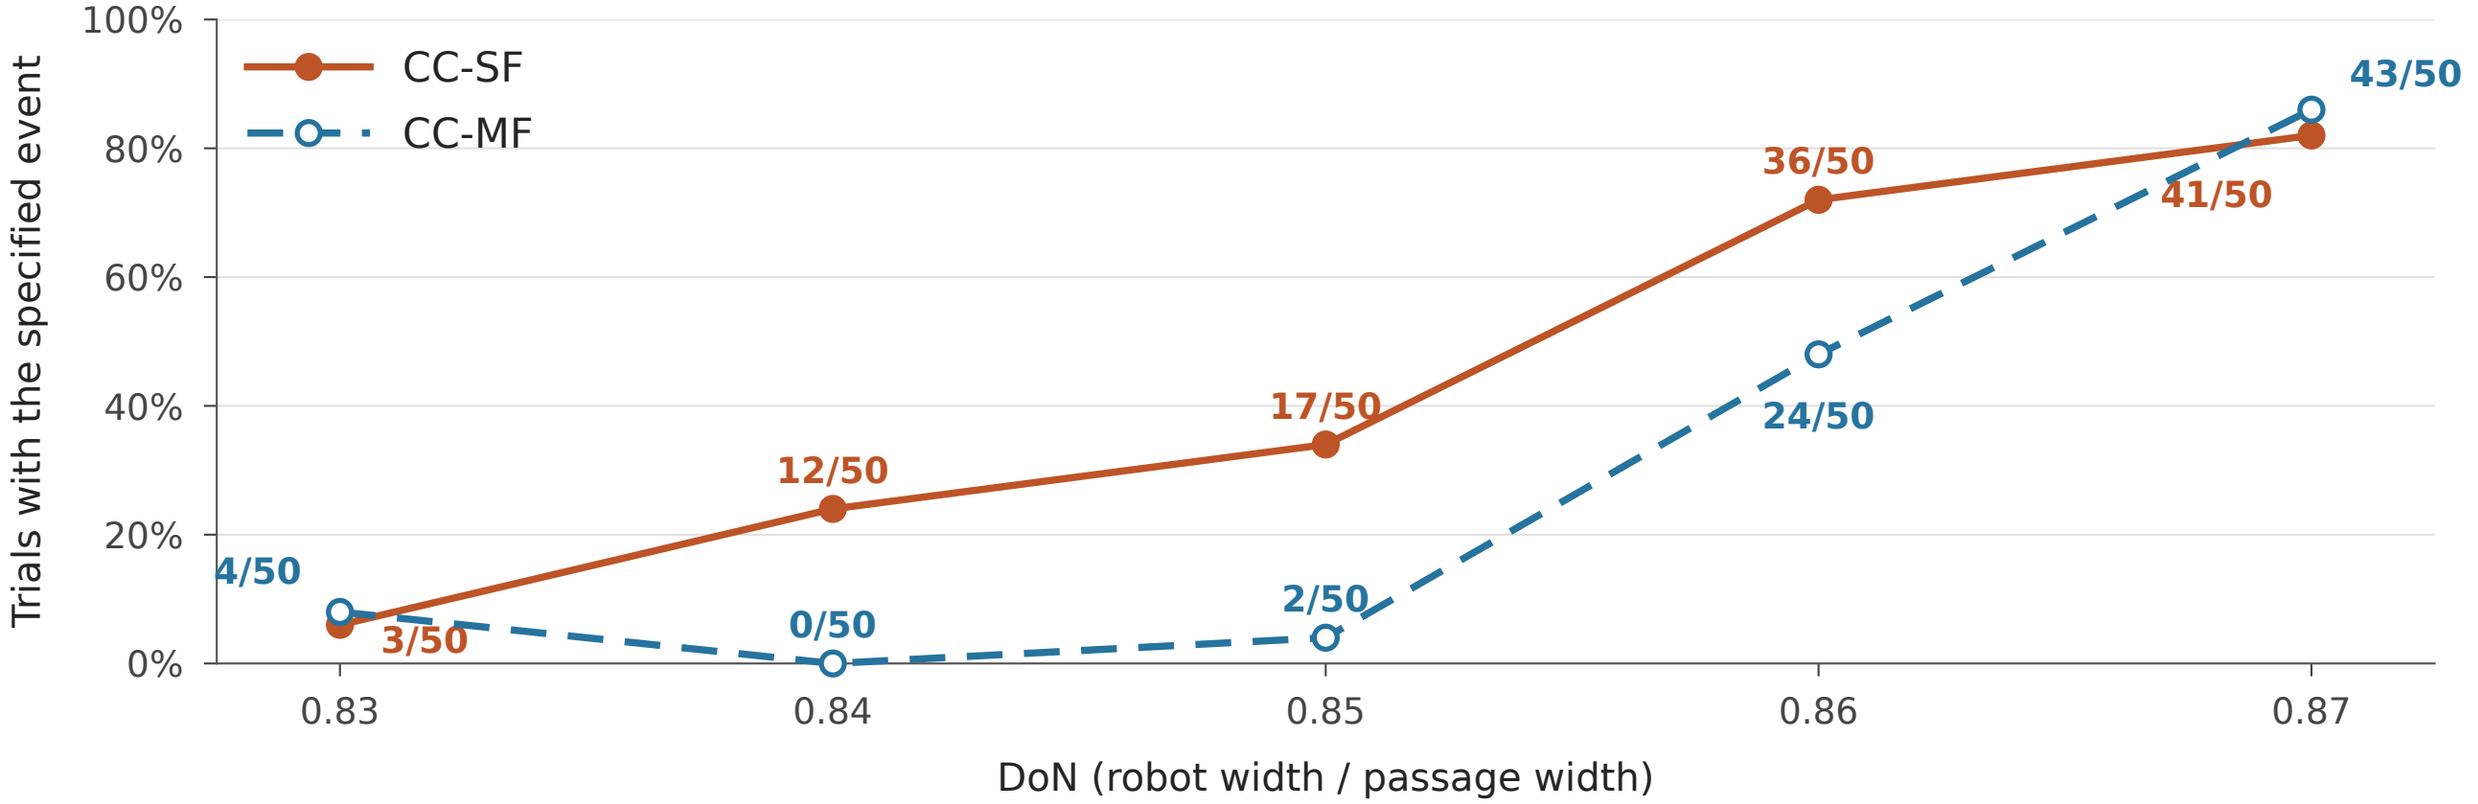
Increasing clearance to one obstacle while entering another obstacle's guard

DoN 0.83–0.87 | 50 trials per controller and DoN | Geometry at actual recorded poses



Event: clearance to the previously closest obstacle increases and stays outside its guard, while global next-pose clearance falls below the guard.

$\Delta d_{\text{old}} > 0, \quad d_{\text{old, next}} \geq d_{\text{col}}, \quad d_{\text{global, next}} < d_{\text{col}} \quad (d_{col} = 0.05 \text{ mm})$. Labels: event trials / all 50 trials.

All 500 trials included. This is an executed-geometry pattern, not the constraint violation rate of optimized candidate states.
